Combining DRGs and Per Diem Payments in the Private Sector: The Equitable Payment Model
Hanning, BW, Australian Health Review, Vol. 29(1) February 2005 pp. 80-86 The many types of payment models used in the Australian private sector are reviewed.

A Comparison of Morbidity and Services Provided in Three Primary Care Settings

The Development of Version 2 of the AN-SNAP Casemix Classification System

Diagnosis-based Risk Adjustment and Australian Health System Policy

This paper examines the application of a risk-adjustment method, extensively validated in the United States, known as diagnostic cost groups (DCG), to a large Australian hospital inpatient data set. The data set encompassed hospital inpatient diagnoses and inpatient expenditure for the entire metropolitan population residing in the state of New South Wales.

Hospital Churn and Casemix Instability: Implications for Planning and Educating the Nursing Workforce

Hospital Services and Casemix in Western Australia

WA has developed its own approach to classifying admitted patients that recognises differences in complexity of care among episodes grouped to the same DRG. WA also has a unique cost estimation model for calculating DRG cost weights, which is based on a linear estimate of the relationship between nights of stay in hospital and the cost of hospital care for each DRG.

National Health Reform Needs Strategic Investment in Health Services Research
Australia is beginning to explore 'managed competition' as an organising framework for the health care system. This requires setting fair capitation rates, i.e. rates that adjust for the risk profile of covered lives. This paper tests two US-developed risk adjustment approaches using Australian data.
